

## Helpful

## Harmful

### Internal Origin

#### *Strengths*

- Provide low ground footprint
- Able to withstand wide range of weather conditions
- Low cabin noise
- Low noise and environmental pollution
- Autonomous flight (no pilot needed)
- Recyclability of components
- High range to mobility ratio

#### *Weaknesses*

- Complexity due to transition phase
- Small range for a wing configuration
- Lower reliability due to many moving components
- Little to no industrial experience
- Time constraints
- High production cost
- Passenger comfort

### External Origin

#### *Opportunities*

- Market incentives/ public awareness for sustainability
- Demand for low ground footprint vehicles
- Need for versatile transportation
- Avoidance of city congestion
- Good connectivity (point-to-point)
- Low market maturity: easier market penetration

#### *Threats*

- Strict noise regulations
- Public reluctance to autonomous flight
- Privacy violations due to low altitude flight
- Many competitors
- Limited infrastructure
- Relatively high-priced
- Niche market
